Queenswood

— WHY CHOOSE QUEENSWOOD

Open-source core banking.

For product teams who design account products, and need to know *what the platform can do*.

Product lifecycle

You draft it, publish it and reprice it, *without a release*.

YOU DRAFT

A product

Built from a template, with your terms.

→

YOU PUBLISH

Version 1

Publishing locks the terms.

→

CUSTOMERS OPEN

Accounts

Each keeps the terms it opened under.

→

YOU PUBLISH

Version 2

New accounts open on it. Existing ones stay.

→

YOU APPROVE

A migration

Existing accounts move on the day you set.

Each step is done in the console, or through the API.

Product versions

Interest, limits, rewards and availability are *configured by your team*, and published as versions.

SECTIONS

Product	GBP · savings
Interest	4.35%
Limits	min £0.00
Rewards	none
Availability	from 2026-10-07

One page per version

Every term of a version is on one page, with each section summarised beside it.

CUSTOMER TERMS

INTEREST

4.35% a year gross (4.44% AER) on the whole balance. Earned daily and paid monthly.

In your customer's words

The terms are written out as you set them, with the AER worked out.

VERSIONS

v3 draft — interest changed

v2 4.35% — published

v1 4.10%

Versioned and dated

Publishing fixes the terms. A new version starts as a copy, its changes marked.

Interest accrual, payment and limits

Interest accrues daily. *You set* the rates, when it is paid, and what can be paid in and out.

RATE GRID

period	£0	£5,000
open	5.00%	0.00%
+12 months	2.50%	0.00%

Rates by band and period

Bands of the balance, and periods after opening or on dates.

PAYMENT

daily · weekly · monthly · 3 months · 6 months · annually · at close

Paid when the product says

On the day the account opened, or a fixed day of the month.

LIMITS

in · amount · **£300.00** · month

Up to £300.00 paid in each month, counted from the opening day.

Limits on money in and out

By amount or count, per payment or per period, counted from opening or a date.

Planned migrations

Existing customers move to new terms *only when you plan and approve it*.

SAVINGS · VERSION CHANGE — completed

Rainy Day holders onto v2

FROM	v1 4.10%
TO	v2 4.35% published
Rate change	+0.25 pp
Effective from	7 Oct 2026

PREVIEW	A dry run shows what would move, and why.
NOTICE	Customers are told before anything moves.
APPROVAL	Nothing moves until you approve it.
MOVE	A scheduled job moves them on the due date.
RECORD	Expected and actual, account by account.

Customer onboarding

Every new customer is *identity-checked* as they sign up.

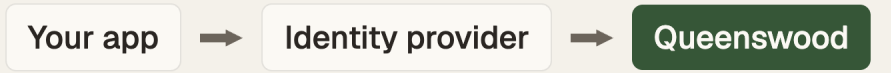

IDENTITY CHECK

Arthur Dent	active
Ford Prefect	active
Zaphod Beeblebrox	rejected

No account until the check clears

A customer who fails the check is refused an account.

YOUR IDENTITY PROVIDER

Queenswood hears the outcome.

Checked by your provider

Queenswood opens the session and hears the outcome. It never sees the provider's page.

Payments

Customers pay and are paid by UK Faster Payments *in seconds*.

FLOWS

Internal	immediate settlement
Outbound	FPS
Inbound	FPS

In, out and between

A transfer between two accounts on the platform settles immediately.

PAYEE CHECK

- match
- close match
- no match

Confirmation of Payee

The name is checked with the payee's bank before the money leaves.

WHEN IT GOES WRONG

held	for screening
parked	in suspense
returned	credited back

Parked, not lost

A payment that cannot land waits in suspense. A returned one is credited back.

Payments and identity providers

Each bank chooses its providers when it is created, and *a simulator stands in for each* during testing.

PAYMENTS

FPS
FPS
FPS

Payments providers

Each connects through its own adapter. Your products and accounts stay the same.

IDENTITY

ID&V
ID&V

Identity providers

The check runs with the provider you chose. Queenswood hears the outcome.

SIMULATORS

Payments simulator
Identity simulator

A simulator for each

Build and test with any provider before a contract is signed.

— 05 · RULES

Limits and capabilities

Rules are configuration, checked in the *same* database transaction that writes each core banking record.

LIMITS

Outbound Payment `micro tier`

`MAX` **500** count `/ day`

`MAX` **£10,000** GBP `instant`

`MAX` **£50,000** GBP `/ day`

Counts and amounts

Counted in the payment's own transaction, so two at once can't both slip past the limit.

CAPABILITIES

Accept an identity check

`ALLOW`	a verification
`DENY`	liveness not verified
`DENY`	not screened for sanctions

Allow or deny

Deny wins. A person not screened against sanctions lists cannot be accepted.

REFUSALS

The 501st internal payment today

`refused`

Micro tier - max 500 internal payments per day

A refusal says why

Every denial carries the reason written on the rule.

— 06 · NOTIFICATIONS

Real-time notifications

Your systems are told *as things happen*.

WHAT YOU HEAR

- An account opened
- Money arrived
- A payment settled
- Interest was paid

Changes, as they happen

A record that gains a status gains a notification.

ENDPOINTS

Endpoint 1	`all kinds`
Endpoint 2	`payments`

Choose what to hear

Register several endpoints. Each receives the kinds you chose for it.

DELIVERY

- `acknowledged`
- `retried`
- `failed, and kept`

Nothing lost silently

Every attempt is recorded, and any notification can be sent again.

Sandbox scenarios

Each scene runs against *the live API*, with simulated money.

01
Publish products

02
Invite operators

03
Verify customers

04
Fund the bank

05
Open accounts

06
Move money

07
Refuse an overdraft

08
Pay someone

09
Migrate accounts

10
Accrue interest

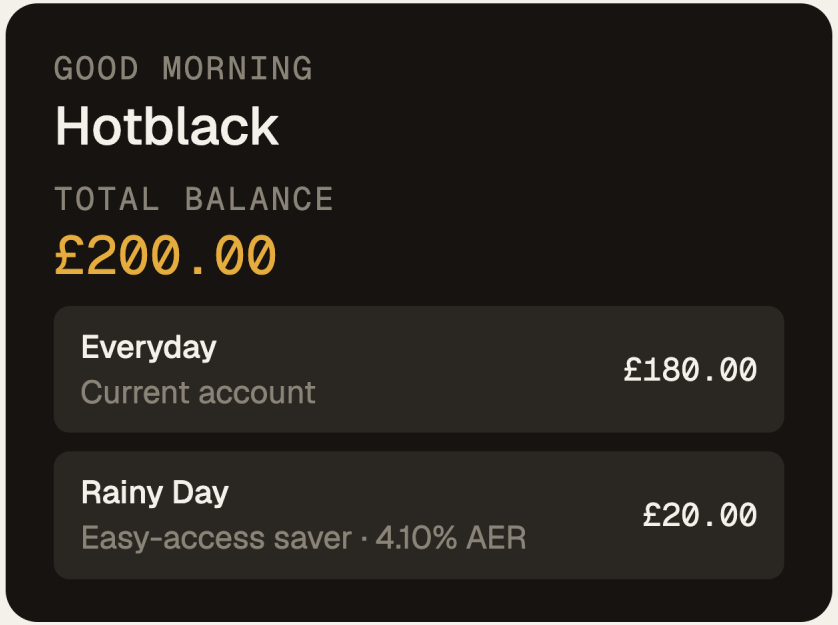

11
Replay a payment

12
Audit a repricing

— 08 · WORKED EXAMPLE

The demo digital bank

A retail banking app built *entirely on the API*, and the reference for building yours.

SIGN UP	Customers register in the app.
VERIFY	The app hands them to the identity provider.
OPEN	They open an everyday account and a saver.
PAY AND MOVE	They pay someone, and move money between their accounts.
ITS OWN	The app has its own backend and store, as yours will.

09 · SPECIFICATIONS

Product requirements

Every capability has a requirements document, *in product language*.

Platform	Products	Accounts	Migrations
Interest	Payments	Parties	Onboarding
Members	Policies	Webhooks	Demo digital bank

Each says what it is for, who uses it, and which questions are still open.

NEXT STEP

Two ways to run it

Your bank starts in test, with *simulated money*.

ONLINE

Open a sandbox bank

queenswood.io →

Register, name your bank and choose its providers. Then run the scenarios in its console.

ON YOUR OWN INFRASTRUCTURE

Run it yourself

github.com/repldriven/queenswood →

Follow the readme to run it on a laptop or your own cluster, simulators included.

Read the source

In the same repository: demo videos, the API reference and design documents.

WHY QUEENSWOOD

Our mission

To put the software that runs a bank *in the open*, for anyone to read, run and improve.

Open to review

Your security team, auditors and regulator can read the code that moves the money, and run the load tests that prove it works.

Yours to keep

Whatever happens to us, you keep the code you run and the right to change it.

Open to contribution

Contributors can add products, providers and new capabilities, and fix faults. Every bank that runs it gets them all.

Path to production

Most open-source projects stop at the code. Ours has a Google Cloud blueprint to deploy, scale and run as many instances as you need.
